

Work Zone Traffic Control Training and Certification

The Oklahoma Traffic Engineering Association offers a training course for the Design and Operation of Work Zone Traffic Control. The intent of the course is to teach the proper application of the principles of Part 6 of the Manual on Uniform Traffic Control Devices (MUTCD).

The course materials include design elements showing the proper design and layout of work zones under varying traffic and roadway conditions. Sample problems are presented to allow the participants of the course to apply the design guidelines to specific situations.

Also included in the material are forms and procedures for inspecting and monitoring the safety and operation of work zones. Participants are tested for certification at the end of the class. A score of at least 80 percent correct is required to be certified. This Certification is good for 3 years and denotes that the individual will place proper temporary traffic controls on a jobsite and can require others - contractors and subcontractors - to make immediate adjustments and fixes to the traffic control plan or traffic management plan whenever there are problems with traffic operations through the job site.
